

Introduction

This report contains the QA testing findings and bug analysis performed on the RealWorld demo application. The application was tested for core functionalities, including sign-up, login, article creation, editing, deletion, and logout flows.

➤ **Add Bug Table**

No.	Title / Summary	Steps to Reproduce	Expected vs Actual	Severity	Suspected Cause
1	Weak password accepted	Sign up using password 123	Expected: validation error. Actual: account created	Medium	Missing password validation
2	No email verification	Create new account	Expected: email verification required. Actual: direct login allowed	Medium	Verification workflow missing
3	Long title breaks UI	Create article with long title	Expected: responsive UI. Actual: layout breaks	Medium	CSS overflow issue
4	No loading spinner	Slow internet during requests	Expected: loading indicator. Actual: blank waiting screen	Low	Missing loader implementation
5	Session timeout without warning	Stay inactive for long time	Expected: warning message. Actual: silent logout	Low	Session handling issue

➤ ***Add Root Cause Analysis***

Root Cause Analysis – Long Title Breaks UI. The issue occurs when users enter extremely long article titles without spaces or length restrictions. The frontend layout does not properly handle text overflow, causing UI components to stretch outside the container and break page alignment. This is likely due to missing CSS properties such as overflow-wrap or max-width constraints. To fix this issue, responsive text handling should be implemented using CSS properties like word-wrap: break-word and proper container sizing. Additional frontend validation can also limit title length before submission.
